

Title: Perils of earth quakes

When an earthquake strikes, the world trembles. The power of a earthquake is greater than anything. Scientists are trying to find way of combating earthquakes. Earthquakes starts without warning. It damages our system. Geologists estimate that during the tremors, whole of the state moved over 80 feet west into the Pacific Ocean.

This is problem that scientists face. Scientists work on predicting where earthquake will strike and least some precautionary measures can be taken to save lives and property.

Idea ok. Mistakes identified. Do not include examples in precis, just give their gist.
