

Global Warming

Global warming is a serious challenge faced by earth today. The rising temperature is disturbing wildlife habitat and has deeply impacted human lives on earth. In recent times, more natural catastrophes have been observed like Pakistan Super floods 2022, that affected more than 33 million people, according to National Disaster Management Authority. Similarly, Somalia drought, that is ^{severe} ~~worst~~ than the 2017 and 2018 droughts, may have killed 43,000 in 2022 and half of them were children. (Aljazeera.com, Mar 23). The phenomena of global warming has irreparable implications for the wildlife too. As per the report of National Geographic, in Montana's Glacier National Park, the number of glaciers have declined to fewer than 30 from more than 150 in 1910 and the Penguin population have collapsed by 90% or more. (National Geographic.com, effects of global warming). The effects of global warming have been felt across the world and high emitters need to cut down the carbon emissions to save the planet as the effects are not confined to borders and the price is mostly paid by the underprivileged and economically marginalized people.
