

Title

A Revolutionary Invention

Man has used boat to travel on water before land transportation was discovered.

Despite this, he has also struggled to invent an object to be used for flying.

Though, the Greek and Italian showed their interest in flying, yet the dream became true in the present times when people discovered the fact that hot air filled into a balloon carry people to a distanced place. Then, hot air was replaced with gas, but this, too, proved inefficient as wind distracted the target destination of balloon.

After the petrol engine was invented and during and after the two world wars, greater progress occurred in terms of safety, size, speed and strength of aeroplanes, which made human mysterious wish a reality. Aeroplanes used as a source of transportation and tool of war.
