

Topic: Despite its urgency, the Climate Crisis remains the most neglected cause.

In the heart of bustling city where honking horns and towering skyscrapers dominated the landscape. A lone polar bear appeared. It stood as a stark reminder of a world in peril. A world where the urgency of the climate crisis had been neglected for far too long. Climate change means long-term shift in temperature and weather patterns. The issue is further intensified by the fact that world leaders have yet not been able to forge consensus on climate change. The neglect behind climate crisis is caused due to a lack of international political will due to short-term economic interests favouring industrial growth, non-binding agreements that lacks enforceability and the continued reliance on hydrocarbons for global trade. Additionally, escalating race of nuclear proliferation ~~adds~~ shows disregard for environment. Geographical disparity play a role as well, as vulnerable regions like small islands are often overlooked. Furthermore, a lack of awareness further impedes understanding and actions.

If the negligence persists the repercussions can be catastrophic for the human and animal species. The rising global temperature is causing melting of glaciers resulting rise of sea level, scarcity of freshwater and floods. Consequently, many coastal cities will be inundated which will cause the plight of environmental refugees. Furthermore, the climate crisis is also causing food and economic insecurity. The solution to this problem requires immediate steps. It requires world leaders to develop unanimity of thoughts to counter this issue. It also demands transition to renewable energy resources, such as solar, wind, hydel, etc. Moreover, it requires promotion of public transportation, cycling, and walking. There are dire need to generate worldwide awareness among masses about this issue. The climate crisis is undeniably urgent, and it is unfortunate that it is being neglected. These neglects have resulted in catastrophic consequences for the planet's future. However, by developing the unanimity of thoughts at a global level, it can be minimized.
