

Job displacement due to AI.

Artificial intelligence has impacted our daily lives rapidly in innumerable ways, one of which is creating an immense void between job aspirants and job vacancies. AI works through automation with maximum efficiency and minimum errors, replacing human employees in every possible field. By year 2025, AI and automation would replace 85 million jobs, especially in routine-based industries (World Economic Forum). This shows a gloomy picture of the proletarian class in the future of AI. Ergo, AI is responsible for creating and increasing the unemployment rate.
