

Climate Change Effect on Balochistan

⇒ Balochistan is facing hard days due to climate change. It has been observed that due to heavy rain in Balochistan in last two years have damaged society and economically almost everyone in province affected due to heavy downpour according to post natural disaster ^{need} assessment (PDNA), Balochistan have lost \$1.6 billion resources as Link roads, Trains track, bridges and other govt official buildings. Moreover, Balochistan has population contribution 6% only but having largest area in Pakistan it can be challenging for government to increase budget and facilities for people of Balochistan otherwise it may face hard days in future. Government should introduce new policies such as innovation in building so that it can face heavy downpour, proper structure for roads so it can't be removed by water. If government does not take serious step it can be serious issue for country because rains and floods have damaged more than external enemy.
