Name: Areej. Wilanianis In resirond laipoloid Batch: 350 Q. Critically analyze the biological thoeories Introduction: Biological theories of criminologi criminality developed with behavior was associated demonic possession or free will of himans. This school of thought proposed that their are there are certain biological sociological and psychological reasons behind a crime being committed. Positivist school of thought argue in late 19th century by Cesare Lombroso. He believed that human doesn't commit crime only by free will but other factors are also involved. In his book "Criminal Man", he highlighed some physiological differences csiminal and a non-ceiminal might have. His study played a fundamental sole in the development of modern Criminology.

Biological theories of criminality Biological theory of down back to the niveteeally century by Ceasare Lambroso He published a book el Criminal Man " in 1880 which was the first work on biological pesspective of criminal behavior. In it his book, he focused on the physical differences between a ciminal and a mont criminal. His book laid the base of further study on biological perspectives He emphasized on anotomical, physiologic physiological or genetic ab normatics within an individual which might be the reason behind a person committing ce wanting to & commit a crime. give heading here Biological theories initiated by C. Lambroso were the first challenge to the ce pre will " approach of creminality. In late 18th century and early 19th according to classical school of thoughts humans were satironal beings and the committed crime due to their own free will. But Cesare Comproso challenged this approach by being a base to none satisfied approach which sounder more sational and acceptable to so ciety.

Phrenology: Lombroxe used phrenology to predict and identify criminal behavior. Phrenology is the detailed study of shape and size of the skull as a supposed indication of character and mental abilities. It proposes that the Shape and size of the skull can tell what kind of a person somerene can be as his mental capability to do certain tasks. In late 18th century; an act was was passed according to which the bodies of criminals would not be buried in grounds but to deepen their pusishment would be hung in chains or be analysed in laboritories for medical purpose. In those centers, skull of various criminals were studied concluding that the skulls of criminals had a slight bump over their right ear. Hence skulls, at that time, were seen as literal hard evidences of a person's character and criminal behaviors. Moreover, Lombreso measured the distance of the toes of criminals and non-criminals, noting that criminals have gap of 3mm more than that of a non-criminal.

Physiognomy: this is not a theory Physiognomy refers to the study of facial features of a person an indication of his character or ethnic origin. Combroso also studied facial features of people and linked them with criminal identity. He identified some specific characteristics which might indicate criminal tendencies, such as: · pointy head · heavy faves. · receding brows · scarty beard Lombreso claimed that criminality was Inhereted and those who were born criminal could be identified by these soits of physical properties. Racist Stereotypes: Combrisso also associated some racial stereotypes with criminal behavior. Since he believed that all Mangolians were oriminal, he associated obeique exetind exelicles with crimina de charateristic. Moreover, according his study, people with lower projection of face or jaws were criminalswho were Negroes in fact. Hend most of his indications were considered racial

Female offenders: Lombroso also analyzed bemale effecters and offenders and wrote book et The Female offender " in 1895. He in his book suggested that most women are not criminal est those who are , are usually occational criminals. Also, women offenders were difficult to detect than men more vicious. According to Lombrosio, women with more masculine physical charatteristics were attributed with biological suspectibility to criminality. For Lambroso, the largest category of female criminals were prostitutes who he believed had more atavistic quality than other females affenders. Somatotypology: The Theory of Somatotypes The somatotype school was developed by William Sheldon, another great name in the history of biological school of thought. He suggested that Criminals can be distinguished on the basis of their distinct physiques which make them suspectable to particular types of antisocial behavior. He classified man into three body types:

a) Mesomorphs: Mesomorphs: have well-defined muscles and an athletic appearance. They are active, aggressive and sometimes violent; and most likely to be criminals. Since they se aggressive and violent, they are most likely to be involved in crimes involving Strength. Mesomorphs are perceived as a threat and are therefore more likely to be arrested. b) Endomorphs: Endomorphis have being build and are slow moving. They are known for lethargic behavior, resulting in unlikelihood commiting a violent crime. they are more willing to engage in a less strenous criminal activity such as fencing stolen property. Endomorphis are not majorly involved in crimes that require strength: or ranning c) Ectomorphs:

Ectomorphs are tall thin and less social. They are known as introverted, sensitive and artistic individuals. Their body is focused on the newous System and the brain hence they are more likely to be involved in crime requiring accessive thinking or brain work. Fer example hacking, aybercimes etc.

	Chromosomes theory: According to	
	According to	
	various criminologists, one of the	
	major characteristic of a criminal	
	biologically is an extra chromosome	
	in his genetics. Generally a male	
	has XY pairs of chromosomes and	
	a female has XX pairs of chromo-	
	-somes. However, a study of Scottish	
	prisoners found that a small number	
	had XYY chromosomes. They were	
	identified as potentially violent and	
	labelled as "supermales". Hence, people	
	with extra chromosome is more	
	likely to be a chrim criminal.	
	Conclusion:	
	These biological theories	
	laid a basis to the development	
	of modern criminology. Though most of	
	af modern criminology. Though most of these studies were denied their
