

## (Paragraph writing)

### Energy crisis in Pakistan

The land of pure has always been a victim of <sup>the</sup> dearth of energy. Third world countries like Pakistan cover an area of  $\frac{3}{4}$ , but are only able to use only one-fourth of the world energy resources. Whereas, one-fourth of the world population utilize ~~3~~ three-fourth of the energy resources. Thus, there have been many doldrums in the energy parity cycle in the world. Historically, Pakistan has inherited huge reserves of coal; but, adding salt to its agony, it is not of the highest quality. Thus, the coal could not be used to generate electricity. As a result of which Pakistan is highly dependent on other means of ~~energy~~ energy resources like oil and <sup>gas</sup> diesel. According to an estimate, Pakistan generate sixty six percent electricity from oil. So, being heavily dependent on importable resources, Pakistan has been entangled in an ever-increasing energy crisis.
