B- Adeption of strategic policies

C- construction of dams and barrages.

D- forestation

E- Water conservation and water sanitation process.

F- Establishment of health sectors.

V- conclusion

# Introduction

Climate change is the biggest threat to the whole world. But poor countries are the most vulnerable to its threats. Third World countries like Pakistan, Bangladesh and Sri Lanka are suffering from the negative consequences of climate change. The people of poor class are facing severe problems of climate change. The marginalized and conserved poor people of country who are already suffering from social and economic losses can hardly manage their basic needs to sustain their lives and now-a-days they are badly hit by climate calamity. Flooding, drought, water scarcity, forest fire, agricultural loss badly affect the lives of these poor class people. They have little or no contribution in climate change but are suffering more than others.
