

Paragraph:-

The Threat of Global Warming and the ways to counter it

Topic sentence :-

Emission of greenhouse gases from industries are the biggest threat of global warming. Among all greenhouse gases carbon dioxide is contributing more.

Explanatory sentence-

Carbon dioxide, methane, nitrous oxide, water vapors, and chlorofluorocarbons are the (greenhouse) gases increasing the temperature of Earth's atmosphere (phenomenon known as global warming) because these gases have the ability to absorb, trap, and scatter the heat.

S.P

Carbon dioxide emitting from thermal power plants, combustion of fossil fuels, steel industry, paper and plastic industry, textile fertilizer, and from cement industry is causing imbalance of its (CO_2) concentration in the environment. Hence, become a monster posing serious threat to environment in the form of global warming.

Since the middle of the 20th century, annual emissions from burning fossil fuels have increased every decade.

According to IPCC, CO₂ contributed 61% toward global warming.

According to IPCC, carbon dioxide ^{level} imbalance in the atmosphere which is 420ppm today while it was 300ppm in 1950.

concluding

This shows carbon dioxide ~~is~~ ^{emission} contributing a major role in becoming a cause of global warming.
