

Essay Writing - Paragraph

India's hydroware is a contributing factor in Pakistan's flooding woes. India is an upper-rapparian country and Pakistan, a lower rapparian country. The control of the flow of waters from the Panjnad river is a major factor of conflict among both states. Moreover, every year during the moonsoon season India tends to deliberately release water into Pakistani rivers without issuing alert notice, which creates a flood situation at the local level.

According to Pakistan Disaster Management Authority (PDMA) Statistics, India last year (2022) had released 173,000 cusecs of water. About ~~100000~~ 16000 cusecs reached the dam, due to which the flood was formed at the lower level in River Ravi. Hence, India's antagonised policies of water management towards Pakistan further deteriorate the situation of flooding across the country.
