make the same categories in outline as done in thesis st i.e. merits and demerits Transforming political Sector Fears Associated with Artificial Intelligence a Invasion of privacy and exploitation of information b Loss of certain jobs c Fear of overpowering human d Taking human instinct lemotions out of life e Creation of built-in biased. algorithms f Accelerated hacking and terrorism Conclusion How is Artificial Intelligence Transforming the World? would be an understatement to say Artificial Intelligence (AI) expression is has taken the world by a storm. The understatement what would conceptual framework of AI is overstatment or truth?

make intelligent: machines which can take desisions by their own without human intervention or imput. The tech-glants such as Twitter, Facebook, i Amazon; etc. are investing billion dollars on AI usages; for they believe it is the future of the world. Artificial Intelligence inasibbeen revolutionizing the world through its astounding features : House Assistants, such as Alexa, are transforming the trade itional houshold experiences. Not limited to this, AI is revolutionizing the medical section, its applications are: helping in better diagnosis and of patients and pathogens Similarly, AI is transforming economic sector, helping companies in sale increase and consumer retentions Besides that ATINES chail? nging the pattern of educationi, inco uraging individual based learning and helping teachers to assis students win a : better way. The most amazing revolution is witnessing transportation sector int roducing selve-drive cars. Stemingly AI device better strategies to : counter aimate inange and political problems. With all these mesmerizing features AI has some fears associated with it. The first fear is the idea that AI is going to overrule human world.

Moreover, AI can be used in activities such as money laundering exploitation of information, terror financing and loss of jobs. These fears can be allayed if the humanity is to wha leavea make the most of it. Beginning with domestic chores do and home improvement, the use of AI in this field has improved the living. Bu experience. The home assistants equiped with the AI are norking from washing to cooking and freezing to moping the floor. These home assistants not only save energy but also bring comfort and ease. This comfort and ease range from cont roling lights and use of televisions and microwave ovens. Similarly AI helps in. making better choices. For example, If someone wants to cut his hairs, AI applications can help him to find a shop or salon, which suits his demands, paket and style. In the same way, AI is also helping human beings come closer to. each other than before, ending their biting longlimess. For example, social media is using AIT bring together peoples with similar interests, creating their groups of like-minded people, which may point to its uses to further grouping the: people for marketing dominance.

avoid pronouns in the beginning of paras Its most astounding use has, however, taken place in the medical field. AI has revolutionized the field of medicine as it constantly saving pat-ients. For example, through a very accurate procedure it san scans the data and helps predict if a patient is susceptable to heart attacks or strosles. This machine learning ability is enabling individuals to maniter their health through devices such as smart watches, wrist bands, etc. Not limiting to this, AI equipped surgical units have surprised the far-flung terminal patients to undergo operations and live again to see the world. This revolution of AI made easy to perform surgeries from distances unimaginable in the past. Another aspect of transforming the medical sector through the AI usages has revolutionized the battle against patrogens. By using the available data on a pathogens, At hidping doctors predict future features of that pathogens and devise a combative strategy against pathogens in advance. Furthermore, AI is seen as an engine of productivity and economic growth. In a Journal published by the Emplean Partiquent, Accenture forecasts that by 2035
AI could double annual global economic growth rates. It further states that
AI will drive this growth in three impDATE: __/_/__

ortant mays; first, it will cause a robust increase in labor productivity. Second, it will create a new virty of workforce capable of solving problems and Self-learning Third, the economy will benefit from the diffusion of innovation, which will have serious impacts on different sectors on account nt of its ability to generate new Amother way through which AT is transforming the economic Sector is through data usage pata collected through social media and other media tech-giants to cater to the merds of the companies and factories targeting sprific consumers. The company can their products according to their customers' needs. Thus manufacturers have become able to predict which product their customers want with the help of the AI. In short, AI has transformed the economic sector for good. In addition to the economic. sector, the Education Sector, too, 13 undergoing a massive transformation; thanks to the AI usage. The AI 13 not only helping the students learn It is also helping trachers keep record

based on their interests, on the other has helped the education evidence with authorities to present customized cutriculum for the future generations As far as the students and teachers are concerned, both can utilize The AI based communication tools cooperation and Knowledge Sharing Moveover, the AI has made the teacher difficult tasks of evaluation easier than before. Traditional methods based examination used to show students have learned but modern methods of data collection, feeling and AI based analysis have enabled trachers to track Students overall performance to better advise the students about their future prospects. Thus, the AI is changing the very contours of the traditional educational setup Another sector, transportation to is witnessing tevolutionary transporta How transformation through the use of first, autonomous vehicles have atready nit the roads around this connection tech-giants competing to take over the electric vehicles market. Greenly drivities. cars are becoming another norm mat is soon going to frex its muscles

tricks have already become operational in the United through enhancing furl efficiency. easily asses how much furl is reg-Similarly, traffic congestion, is going witness solution invoyer of, as are going to help collect the minute traffic details to assist uters avoid congestion sceking aftergoing to transform the transport Sector is changing the mature of jobs for men, creating alm discuss ost a threatening as well as a com merits and demerits orting sense for the people. The robots separately now replacing human beings in performing traditional jobs, like the industry workers. Although the people naving techical skills carn more the assembly line production and robotic automations have changed this outlook too. Although it seems that AI job market is blooming at the moment the day is not for when it will also face automation, red ing thousan

of operators jobless. And, it seems Comforting that human beings will have leisure to enjoy like, a country of the AI and its vaste usage. Besides mat, AI has also proved beneficial for dreveasing the impacts of Climate Change much better than before For example, recently it has helped In the detection of deforestation through satelite imagery, or gental imagery, including gathering of data about where buildings and infrastructure used to stand in the past. Such a move is essential in policy making to deal with climate change issues. Research from Mostness Institute for Learning Algorithms (MLA), Microsoft, and Conscient AI Labs used GANs, a type of AI to Stimulate what homes are likely to look like after facing dangers dang ges from vising sea level, and violent storms. Similarly, A7 enabled computers. help analyze a load of data to pred ict the next seasonal change. The day to day weather forcasting is based on the same logic. It glso helps in predicting future floods based on weather pattern and water level in the rivers. Using these predictions, met espologist can propose the public to country the future contactorphic

in advance. Not only that, but also the help in tracking our progress ast but not the least, A? technology contributes to the develoof political theories in proportion in building new found. in political action that have the ability to inderstand the pattern and challenges facing the future of political and governments. It provides database that enables decision makers to make decisions quickly effectively, help them manage exists political problems by analyzing and interpreting information monitoring the process of treaty, bilateral multilateral treaty, conventions an alliances. In the diplomatio freed, AI ngs had an indirect impact in chan work by supporting the functions of diplomary and the daily tasks mats. Developing modern diplomatte means, today called digital diplomary on virtual space, negotiation foreign public by reducing

Ministry announced its plan diploments and to homefit information and data provided oy AI termology In brief, AI transforming political sector for These highlighted AI merits demonstrate its bright future in the Situation when giants like Mark Zuckerberg have stated, AI is a boom bestowed upon us and it will positively affect bur lives in multiple ways." Contrary to his statement, Elon Musk innovator, argues " AI will undermine our freedom and security and be detriemental to the Survival of the human nate in the not so distant future? This categorical statement by a tech innovator. highlights challenges that AI is going to pose to the human race in the snape of its demerits Challenge through its invasion of human privacy, and exploitation of the information gathered about

DATE: __/_/__

individuals. Given its pervasive general life, it is able to and analyze each move of a cameras installed at every place in cities use facial ny cognition The case of U.K.'s Breat strates AI's power for social manipulation. By spreading data to people known through algorithms and private information, AI targets and reveals data disagreed distegard the personal consent or valigity data retrieved or obtained. Briefly putting it, AI is posing Scripus challenge to human provacy and personal identification information Secondly, as machines taking over majority of the manual works there will be time when there is very less manual work left for human beings, triggering a mass unemployment, and this ready happening on industrial scale intelligener based and chattoots are taking automation system have slowly prased out but on the otherside its brodict that AI will create 97

Aclinia ew jobs by 2025. Inshort it see that AI machines are going to take jours more than it is expected. Thirdly, while AI presents tremendous opportunities, people uncertain of its likely impacts, and 98x picturing possible worst-case scenarios including comptete overtake of the human affairs, and incapicitation of human abilities. Exposts. researchers and scientists often issue warning statements that we as human beings, are creating a new good that can either be merciful and good, or vicious and evil According to AI resequiliers, machines are predicted to be better than us in translating language by 2024, writing high School essay by 2026, driving a truck by 2027 writing a best selling book by 2049 and doing a swigery by 2053. Infact, it seems that all human jobs will become automated within the next 120 years. In this screnario, it is likely that AI enabled machines are going to replace human beings. Moreover, Since AI algorithms are man-made, they can have be biased inserted into the algorithms tionally or imadvestently. IF AI algorithms

DATE: __/__/__

are built with a bias, or the data is compromised, it is certainly the case that the results are biased. This reality of biased or compromised data could lend to unintended consequences. In 2019, researchers found that an algorithms used in us hospitals to predict which patients with will require additional medical care favored white patient over black patient. Because the expense of healthcare emphasizes on individuals health. care needs, the algorithms considered the patients past healthcare expenditure Inshort, there must not be intention. all or imadvertant data inscrition into machines through AI algorithms. last but not the least, AI has led human beings to increase the speed of human performed tasks, and in some cases, it exceeds our abilities. With automation métarious acts such as prishing, delivery of viruses to softie ares, and manipulation of AI operated systems seem to become difficult for humans to control. Similarly, their may be new AI - enabled form of terrorism to deal with due to the expansion of autonomous dromes, and the introduction of robotic swatms to remotely attacks, or the delivery of disease through? mano robots. The law enforcement
