

Is Artificial Intelligence (AI) and Robotics going to push the world into another economic recession by a way of replacing human jobs?

1- Introduction

2- How Artificial intelligence works

3- Is Artificial intelligence creates unemployment.

a- Industries where AI replaces humans

b- AI replaces human in manufacturing sector

c- Humans ~~are~~ are more intelligent ~~than~~ and robots ~~are~~ are unpaid.

d- AI replaces In food sector no jobs for humans because of AI.

e- AI works in hospitals.

4- Advantages of Artificial intelligence

a- AI is performed better than human

b- AI performance takes less time

c- AI is better than human in physical task and human are ~~paid~~ want salary.

d- AI increases the productivity produces more in comparison of humans

e- AI diagnoses disease faster

5- How Artificial intelligence and humans work together and protect the world from economic recession

a- New technology not only creates unemployment but also creates opportunities.

b- Some tasks can only be performed by humans such as operating a robot.

c- AI and robotics cannot run the economy without human involvement.

d- Both can work together to run the business better.

e- Government make sure that the artificial intelligence work for the betterment of all the members of society.

f- Conclusion

INTRODUCTION

The industrialisation era was not warmly welcomed by all. People fear that it will replace the man from job and the man will unemployed and consider it a threat to the tradition. But after some times the people understand the importance of industries.

Some is happening with artificial intelligence. People feared that it would replace the man and lead the world to economic depression. But with the passage of time people will understand that it will only be for the betterment of people.

Artificial intelligence increases day by day. It's expansion creates positive as well as negative impacts in the modern world. It has more positive impacts than the negative.

and we can minimise the negative effects through strong checks and balance. The

AI replaces the man in many sectors such as in industries, manufacturing sectors, food sectors and also in hospitals. It replaces man because it performed better than human,

consume less time and produce more. It is also profitable because ~~the~~ artificial intelligence is unpaid. However it performs better than human but without humans ~~&~~ this is nothing. Both the artificial intelligence and man run the system efficiently.

CONCLUSION:-

In summation, it is clear that Artificial intelligence performed better than human in every sector. As they are less time consumer, produces more items ~~the~~ with better quality. This is easy way to get profit rapidly. Most important thing is they are ~~the~~ unpaid, has no demands like awards, salaries, working hours etc. So they are suitable for owner. They are better in performing physical tasks but in intelligence humans are superior. They are not just create unemployment but creates many jobs just need to focused on it. As this is the era of Artificial intelligence, so we need to learn about it, like what is AI, how it work etc. People should

aware about it. Government encourage
the people to learn about it and
introduce programmes through which easily
understand about it. Most important
man should learn about making
and designing of robots in
order to make future better.
