

Climate change.

One of the grave problem world is facing today is climate change. Climate change investigate global warming. There are many factors that contributes towards climate change. Firstly, population explosion it is directly contributing to climate change as the increase in population requires more food and other facilities, causing increase in food insecurity as well as rise in solid waste. Thus the over population & contribute towards climate change as there will be more need of transportation that will increase pollution. According to IPCC fifth report transportation contributes 15 p.c in air pollution. As the population increase it calls upon the for every facility so to meet this there will be requirement for more industrialization and urbanization, both these will have a drastic effect on climate. All these human activities cause increase in CO_2 . According to global watch 61% of global warming is due to increase in CO_2 . Thus, Increase in population is a serious threat that is contributing towards climate change.
