

Artificial Intelligence:-

Artificial Intelligence is the advance system of computer that can perform tasks, normally required human intelligence. For example translation of different languages, speech recognition ability and ^{provide} full information on any topic.

For any country artificial intelligence is fruitful but also threatened. If we talk about Pakistan, AI is a good blessing for every field, either in healthcare sector, agriculture, education, business and economy, and natural disaster management. In every field AI play vital role.

In Pakistan, AI play important role in the department of medical, it improve the medical services, such as

diagnosis of diseases, prevention of diseases and drug discovery. With the help of AI medical test reports are produce in minutes.

Similarly in education department, AI boost the education department in very well manner. Specially in COVID-19 time, all sectors were closed but with the help of AI, education department was continuously worked. and ~~pragmatically~~ Now education every Pakistani have approach towards virtual education. Google, chatgpt, these are the easy way to get knowledge on any topic.

Moreover in agriculture department, AI introduce new technologies of harvesting the crops. AI also contribute in seed

developing techniques and to
make new machinery
which are very helpful
for the production of
crops.

Additionally, AI play an
important role in the
Business and economy.

In Pakistan a large
numbers of online
business are running
and earn good incomes.

Due to AI 97% job
will be created, and it
is good news for Pakistan.

Similarly, AI help in
assisting the natural
disaster, early warning
system, disaster response
coordination and damage
assessment during natural
disasters.

AI has the potential of
numbers of benefits but
besides the benefits

it has also risky for the future of Pakistan. Such as AI will decrease the job creation, security and privacy risks, economy disparity, loss of human control, spreading fake news and also claimed that AI will be the reason of 5th generation war.

In Pakistan, AI get control over many of departments, and these tasks are performed with the help of machines instead of men. AI is the main reason of job lost. According to UNDP report 85% jobs will be lost.

Similarly, AI creates problem of security and privacy. because AI

have large amount of data that is difficult to manage

Due to this reason many cyberattackers attacked and hacked the data. This is very risky.

Similarly, AI is the platform of spreading fake news, these fake news enhance many type of conflicts in the state

in the propaganda. Many of politician using this platform for spreading news against other parties. This work is very dangerous for any country.

As concluded, it is very important to note that threats of AI are much lesser than the benefits. Threats are initiative when AI mishandle the AI and not be use properly

overall it is good thing
and also claimed that
next era is the era
of modern technology
(AI) Without this
Pakistan can't be
compete with other
countries.
