

1. Introduction

1.1) Thesis statement

2. Contextualizing the term climate change and climate how it started.

3. Why climate change crisis is left undressed or neglected

3.1) vested interests of developed industrial nations like the United States, China and 28 European countries

lected

country

3.2) Developing countries in South Asia, South East Asia, Africa and Latin America
has lack of resources or funds to address the challenges of climate change crisis - though they are most affected by it

3.3) Lack of technological advancements on part of developing countries thus

Date: _____

rely on outdated strategies to address the threats of climate change crisis

3.4) Developing countries vulnerable to the extreme climate change crisis have little influence in the world politics.

4. Implications of Climate Change Crisis

4.1) Floods - Extreme weather events

4.2) Wildfires in Canada

4.3) Droughts in Bl. Bangladesh

The phenomenon of climate change has been considered as the modern age's leading environmental problem. Climate change is expected to have harmful and long-term effects on natural resources and the entire world on political, economic and social fronts. Climate change is a growing challenge to global security and is expected to impact human health in many ways, including excessive heat, environmental pollution, food shortages and the severity of outbreaks of diseases. However, the issue of climate change is left neglected due to their industrial nations like the United States and China's personal interests, lack of resources of developing interests, technological backwardness of developing nations and immediately affected by climate crisis are those nations that are less influential in global politics. If left unaddressed climate change could pose a major threat to global economy, peace and stability and therefore it has been identified as a "threat

deforestation, industrial and agricultural practices have not resulted in climate change. In return, the impact of climate change phenomenon has been evident in the form of high ranges in temperature change, substantial shifts in rainfall pattern, frequent and severe weather conditions such as floods, droughts, storms, sea level rise and foot waves that directly impact human health, environment and overall natural system.

The cause of climate change crisis is left neglected by the world due to apathy of industrial nations, lack of resources of developing nations, technological backwardness of developing countries and vulnerable nations to climate change disasters have no or little change in global politics. The first sign in global politics. The first and foremost cause of climate change is that not developed states of the world account for a larger portion of global greenhouse gas emissions. For instance, in year 2012 China was responsible for 27 percent of global carbon emissions, followed by the United States with 14.5 percent and 28 European states with 10 percent

multiplier" and "accelerant of instability" as it is evident from the fact that in many underdeveloped states of the world, climate change first occurs, then economic destruction hit is the country, then civil war and terrorism break out which in turn threaten the security of the state. Thus, looming threat of climate crisis is the worst neglected phenomenon in present times, however, if left neglected it can cause numerous socioeconomic, socio-political and global repercussions for the entire world. Hence, need of the hour is to take pertinent measures at domestic, regional and global dimensions.

Climate change is a broader term that involves both the global warming that is driven from the emission of greenhouse gases and large-scale variability in weather patterns. Historically, the phenomenon of climate change emerged in the early nineteenth century when greenhouse effects were first identified, and rapid changes were suspected in climate since the time of industrial revolution human activities of emission of greenhouse gases via fossil fuel combustion

of carbon emissions as per the report of Intergovernmental Panel for Climate Change (IPCC). These countries are still following the same path by not cutting their carbon emissions even after knowing the fact that climate change is ticking bomb over developing countries more severely.

Secondly, the next cause of neglected issue of climate change is due to climate change effects which are more disastrous in the developing countries of the world. For instance, in South East Asia, children and women are nutrient deficient, in Africa the agricultural sector is devastated that the extreme droughts are witnessed, in Latin America the natives are forced to leave their natural habitats, similarly in Pacific Ocean small island states are coping with existential challenges. But these countries have less resources to develop ways and means by which they can address the challenge of climate change. Lack of funds is a major hindrance due to which

Date: _____

these countries could contribute majority in climate change mitigation majorly technologies. These states are dependent on individual nations to help them cope with the challenges of climate change. Therefore, lack of funds and resources is a major setback in addressing the issue of climate change.

Thirdly, lack of technological development in terms of adaptation technologies to climate change is another cause of neglected issue of climate change by developing world. Fundamentally, addressing of nations having all the technological advancement to address climate change are not doing technological transfer to the developing countries. In several prominently, developing nations that are least technologically backward are unable to acquire advanced technologies to mitigate the effects and challenges pose by climate change. Thus, the issue of climate change is neglected

Date: _____

Fourthly, developing countries that are most vulnerable to climate change are those who have little or no influence in the global political arena. Countries like Pakistan, African countries like South Africa, countries like Indonesia, Malaysia have very little influence. That is why their concerns and challenges are neglected in the global politics. Thus, the climate change crisis is left neglected.
