

Topic 1: Globalization Leads to the North-South Divide.

Globalization, undoubtedly, has many impacts on the world, chief among them is that it leads to north-south divide. Globalization, in fact, is the process of increasing interconnectedness of world in various ways, such as socially, politically, and economically. On the other hand, it has become one of the prime reasons of creating disparities among different parts (regions) of the world. Historically, rich and developed countries of the world have exploited the developing countries of the world. Prior to Britain's entry in India, Indian gross domestic product (GDP) was 23% of the global GDP. However, when Britain left India, it was reduced to less than three percent. (An Era of Darkness - The British Empire in India, Shashi Tharoor, 2016). Similarly, economic gap between different parts of the world is rising. For example, rich countries, such as USA, China, UK, and European countries are becoming ~~more~~ richer than least developing countries of the south. And it is all because of globalization. Hence, the growing divide between north and south is one of the main impact posed by globalization.

Topic 2 : Quality Education is the Reason of Increasing Urbanization

Increasing urbanization, in fact, has various reasons, one of them is the ^{access to} quality education. People in rural areas lack access to quality education, therefore, in order to have access to such facility, families and students migrate towards cities. Generally, in cities there are more facilities and educational institutions. For example, the capital of Pakistan, Islamabad, is a case point where there are more than six top universities. Hence, students are highly attracted towards such a metropolitan, which causes swift urbanization. The population of Pakistan capital has touched 2.2 million now from its total 0.4 million in 2003. (Census data, Pakistan Bureau of Statistics, 2017). It substantiates the argument that rise in urbanization is primarily because of good educational institutions. In a nutshell, the population of urban areas is increasing due to facility of quality education.

Topic 3 : Rising Sea Level is the Consequence of Global Warming.

Rising sea level is one of the major consequence of global warming, in fact, it can wreak havoc to the future of planet. The sea level is continuously rising due to repeated expansion and melting of glaciers. As a matter of fact, global warming is increasing due to excessive emission of greenhouse gases; alongwith this, the average temperature of the planet is also on rise, which results in the quick melting of polar ice and glaciers. If global greenhouse gas emissions remain unchecked, global sea levels could rise as much as 3 feet by 2100. (Sea level rise, International Panel on Climate Change, octobar 2018). God forbid, if this happens, it will brought an infinite destruction to the planet. Therefore, it is an alarming situation not only for the planet but also for the mankind. As the sea level ~~is~~ ^{has} already risen to 6 inches in the previous two centuries, inundating a vast agricultural area near seashores. Hence, the rise in sea level is a grave consequence posed by global warming.
