Is the environment going to listen our promises?

Outline

1- Introduction

Thesis statement: Definitely, environment is not going to listen our promises (which is proven from global rise in temperature, geographic vulnerability, population explosion, etc. But, some critiques are opposite to it. However, strong arguments are in favour of that environment is still not ready to listen our promises.

2- Natural environmental stewardship: An overview

3- The environment is not going to listen our promises (Thesis)

- a) Annual rise in temperature poses threat to environment
- b) Geographic location of countries like Pakistan shows vulnerability to environment
- c) Population explosion puts oxygen to environmental hazardous
- d) Massive deforestation is a proven fact of environmental failure
- e) Fossil fuel energy generation has weakened natural environment

4- The environment is going to listen our premises
(Anti-thesis)

- a) International commitment on reduction of global temperature makes environment favourable
- b) Awaiting of possible opportunities has understepped geographic vulnerability
- c) Population control policies have stepped towards a sustainable environment
- d) Forestation and reforestation have improved quality of air
- e) The world has been shifted toward clean energy

5- The environment still is not going to listen our premises
(Synthesis)

- a) Ineffective implementation of global commitment ensures unsustainable environment
- b) Despite awaiting of opportunities, environmental threats are ongoing
- c) Population policies are just paper limited that enhances environmental risks
- d) Deforestation is more than forestation which claims environmental vulnerability
- e) The world has still a huge gap of clean energy

6 Conclusion

Annual rise in temperature poses threat to environment

The environment is not going to listen our promises which is clear from annual rise in temperature that poses threat to environment. No doubt, rise in annual temperature is ongoing dilemma in the world. Unprecedented increase in global temperature shows that environment is not in favour of our promises. As per report of the United Nations, "The global rise in temperature is reached at 0.5°C " (The United Nations, 2023). This is a proven fact that annual rise in temperature poses threat to environment.

International commitment on reduction of global temperature makes environment favourable

Beyond any doubt, environment is going to listen our promises as international commitment on reduction of global temperature make a favourable environment. In fact, the world has agreed to reduce the rise of global temperature. As a result, global commitment on reduction of temperature leads to the world towards a sustainable environment. Recent in 2021, COP 27 was a global conference that called

an urgent meeting on sustainable environment," All countries became agree to reduce temperature by 1.5°C by 2030 (The COP 27, 2021). Hence, the international commitment on reduction of global temperature makes environment favourable.
