

Introduction Paragraph

Is Pakistan ready for a digital revolution

"I love those who yearn for the impossible" (Goethe). In history of mankind people have strived for the things which seemed impossible at first glance but with their utmost dedication and will powers they achieved their goal. This quote of Goethe acknowledges their thirst and passion for the impossible but for achievement of goals there are some mechanisms must be followed and without those mechanisms desired goals are just a brainchild. When this concerns a state then there are some pre-requisites to be followed and for a state which is suffering through socio-economic issues importance of these pre-requisites doubles. Now when we consider Pakistan, Pakistan due to its poor economy and high illiteracy rate is not in a position to initiate such a revolution. Political hindrances and lack of technological support are just add on in the complexities. Other severe problems being hurdle for a digital revolution include poor governance of rural areas accompanied with suppressed economy and political interventions. Although literacy and digital revolution are apparently independent of each other and countries facing same socio-economic conditions have excelled in this field

but a majority of States is still struggling with this advancement. Digital revolution concerns masses and for a strong proper digitalization we require their participation. Moreover a number of Pakistani renowned scientist and technology experts are expatriates now and for technological installations their services are of immense importance.
