

The Wheel

There are numerous (of) inventions spread around us, but the oldest of these is the wheel. The Sumerians invented the wheel around 3000 BCE in the region of Mesopotamia located between two rivers: Tigris and Euphrates. They originally used it for shaping the clay. With the passage of time, it was started to be used for other purposes such as lifting the heavy objects. Now, in the era of industrialization, this circular-shaped wheel has reduced the distance all around the circular planet Earth. Nobody can imagine the existence of highly efficient modes of conveyance, which we have today, without the invention of the wheel. Different vehicles have one, two, three, or even four wheels to support the movement of things and people from one place to another. To cut the long story short, the wheel has made the human life easier and happier.
