

Climate change

It was the best of times
It was the worst of times

(Charles Dickens)

Not a tale of two cities but the
tale of two planets. Earth and Venus
are essentially of same size, essentially
the same distance from Sun and
both have exactly the same amount
of Carbon. The difference is over
time on the Earth, the Carbon
have been trapped on the ground
in the form of oil, coal, natural
gas. Whereas on Venus the
most of the Carbon is on the
atmosphere. The difference that on
Earth the average temperature is around
on 50°C whereas on Venus it is
around 850°C , not because it is
slightly close to the Sun, Mercury is
closest to Sun and it is around
3 times cooler than Venus. This is ~~not~~
one can rethink our current strategy
especially developing countries as much
ground based (strategy) Carbon and
eject it into the atmosphere.
The climate crisis is something

whose consequences are not local but are global. Not individual is affected by it but the whole population also comes in this circumstance.

Climate Change is becoming a huge problem now a days. The whole problems regarding climate happen just because the overly use of carbon. These problem have huge disaster on human resources but also on all the living things. When a flood comes, it not only effect humans and human belongings but also the other living organisms like, aa plants etc. The Earthquake not only effects the (human) people but also the animals. Climate change disasters are not confined to a small area but these are immense. The land sliding cause by this phenomenon. The over tensed cold and hot may create many problems for humans. The lives of people are lesson day by day. This is just because of overly use of carbon in our life. This use is in the form of gas, coal and oil that we use it in our industries.
