Combustion of Fossil Fuels is the main cause of Atmospheric Pollution.

Fossil Fuels are non-renewable energy resources, which include: coal, Diesel, natural gas and oil.

The combustion of these non-renewable resources produces Carbon dioxide (CO_2), carbon monoxide (CO), Sulphur dioxide (SO_2) etc which are major causes of Atmospheric pollution. ~~I saw a~~

A report of IPCC (Inter Governmental panel on climate change) ~~which~~ indicated that ~~the~~ one of the major reasons behind Atmospheric pollution is Combustion of Fossil Fuels.

Further, IPCC wrote in their report that combustion of Fossil Fuels in Energy sectors pollutes the environment or Atmosphere 35% Percent. 28%

Atmospheric Pollution occurs due to the combustion of Fossil Fuels in Agricultural sectors. ~~The~~ Industrial sector ~~also~~ pollutes 21% Atmosphere by the combustion of Fossil Fuels.

Hence, the combustion of Fossil Fuels are the main cause of the Atmospheric pollution. recorded.
