Cause

Along with, the inefficient policy, carbon emissions is also the cause of climate change.

Carbon emissions accelerate the climate change in Pakistan. The burning fossil fuels, coal, gases are increasing the threats of climate change in Pakistan. In fact, the country is using the heavy amounts of fossil fuel, coal, gases which pollute the environment. The higher transportation increases the air pollution. Similarly, the harmful gases are also responsible for the global warming. Therefore, the burning fossil fuels and harmful gases lead to environmental degradation which increases the risk of climate change. According to an analysis, Pakistan is using one of the highest fuels consumption due to transportation sector and carbon emission sector. Pakistan's transport sector has created many environmental problems in the country which is a threat to climate change. (M. Yousef, Analysis of energy related CO₂ emission in Pakistan, 10 May, 2019).
