Mini Essay

Pakistan is rich in Natural Resources but poor in their management.

Outline:

1. Introduction
 - a. Thesis Statement
 - b. What are Natural Resources?
2. Natural Resources in Pakistan
 - a. Renewable ^{energy} Energies in Pakistan
 - b. Non-renewable ^{energy} energies in Pakistan
 - c. Measures for facing poor management of Natural Resources in Pakistan Argument is not clear
3. Conclusion
 - a. Restated the thesis statement
 - b. Step forward for maintaining the Natural Resources in Pakistan.

Introduction:

Thesis Statement: Pakistan is one of the richest countries in terms of natural resources. Because, it has ~~God gifted~~ having various types of natural resources. ~~Energy~~ ^{energy} of them are: renewable and non-renewable energies, and Pakistan ^{is} facing many problems for their management.

Actually, the natural resources are the types of resources which naturally occupied from the different places of earth. It is mined from earth in terms of impure elements. Few of them listed are: the metals which are in the form of gold, silver, diamonds, copper, tin, etc. ~~The~~ process of purification of various elements into pure forms is called mining process. Some other resources are: like renewable energies which are in the forms of hydropowers, agricultural sectors, solar and wind energies, etc. Those energies which involved again and again in the process of creating more energy is called renewable energies. On the other hand another resources like non-renewable energies which are in the form of coal, gas, oil, etc., and in this process we use only one time of its energy to utilize and that process known to be non-renewable energies.

The location of Pakistan is geographically and geo-strategically perfect for natural beauties and resources respectively. Because, Pakistan has ~~God gifted~~ many forms of natural resources.

The beauties of natural resources from various mountains, lakes, and beautiful scenarios makes our country more richer in terms of natural resources. One of other example is that it (our country) has been annually facing four different types of a season in a year to makes great conditions for resources. Some of the few list of natural resources which are present in Pakistan according to the global ranking of natural resources of the world, Just like in terms of coal reservoirs our country stands at second-position, in terms of Gas reservoirs our country stands at fifth-position, in terms of salt mine reservoirs Pakistan stands at Second-position, in terms of copper reservoirs Pakistan stands at Seventh-position, in terms of oil barrels reservoirs Pakistan has 436.2-Billion Dollars, and in terms of gas provided from oil is about 31.2-trillion dollars. Few other resources that are founding from Pakistan are ~~renew~~ in the form of renewable energies and non-renewable energies.

There are many renewable energies has founded in Pakistan in terms of natural resources just like solar and wind energy, agricultural sectors, hydropowers, and minerals and ores etc. In solar and wind energy there's a project which has been launching at Jinnah. It has capability of converting wind, air, and sun's energy into the form of electrical energy which are using for electrical purposes. It has been an

ability of giving 40,000 Megawatt (MW) powers to run electrical resources. On the other side in agricultural sector there's fifty-five percentage of usage in our country. Mainly, in that there's a 34.6-percentage of male labours while 64.4-percentage of female workers has been working in field, and also it is the part of our country's GDP. Moreover, hydropowers is another source of natural resources in Pakistan. In that process converting of water following energy into electrical form of energy, it produces thirty-three-percent power for the country's usage. Additionally, minerals and ores in our country are the most richest country among all. In various places in our country where those minerals are extracted from earth through mining process. Some of the most minerals are: copper, gold, tin, silver, brass, etc. In terms of copper and gold Pakistan's largest mines are located in Reko Dik, near Balochistan. Some other minerals and ores in Pakistan are like gemstones which has founded in various parts in Hunza, Gilgit, and other areas. These mined gemstones are found in the form of precious gems, topaz, ruby, sapphires etc.

As like renewable energies, Pakistan has also gifted with many forms of non-renewable energies as well, and those non-renewable energies are in the form of coal, oil, and gas. In term of coal energy, Pakistan has gifted

by nature with vast of its resources. Because, coal is a mineral in which it contains many types of products as well as by-products also. Such products which are used in our daily life in form of polishes, varnishes, and paints etc. On the other hand the by-products which are also used in our daily life routine such as: fossil fuels, petrol, etc, which are used for running wheels of automobiles, industrial goods and other mechanical sectors in our country. The Project "Thar-Coal-Project" has launched near Tharparkar, Sindh, Pakistan. It has a capacity of producing the 1000,000 Mega Watt (MW) powers to run the electrical resources. On the other side Gas also become the part of natural resources of Pakistan. The project of gas has launched near Balochistan. That project name as Sui-Gas. Because of it has located near the Balochistan's Region Sui-southern areas. It provides the natural gas which are mainly composing of many forms of impure minerals that are present in it and also provides methane gas which are commonly uses in our houses for cooking purpose. Moreover, the oil is another form of natural resource in Pakistan. It has been used for running the mechanical automobiles, and industrial goods.

Many hurdles has been facing by our country in the management of the natural resources of Pakistan. First of all, the big hurdles which

are facing in renewable energies management. There is no proper maintenance of resource for continuous working on such projects of solar and wind energies to produce more electrical power supply from them. Some issue happens in hydro powers, minerals and ores, agricultural sectors and many other forms of energy that causes lack production because of no such good maintenance and that's the one of reason Pakistan is partly in management of natural resources. Secondly, in non-renewable energies we also facing same issue due to lack resources available to our country. Finally, these hurdles has impacted the condition and situation of our country in that way the GDP of our country falls down. The biggest reason that has faced all the time is due to the lack of outcomes from the projects and leads to poor management and also lack of maintaining system in our country.

Conclusively, we can say that Pakistan is the most richest country among the world in terms of natural resources. But, the poor in management of these resources due to the lack of resources available to our country. That's why the management is so poor. It's overcome or step-forwards for these management through political instability, maintains the program of Foreign Development Institution (FDI), and promote tourism and provide the tourist security, etc. In that way our country one

DATE: ___/___/___

Day will ~~progress~~ through the management
and ~~improve~~ the maintenance of it's natural
resources.
