Effect of Weather on Human Effectiveness

Positive effects of the cold can be observed in Northern European temperate countries. Moderate cold weather acts like an obstacle that compels a man to work hard. If an obstacle is too hard like extreme cold conditions, a man becomes disappointed and his energies get numbed. Contrarily, hot weather conditions are comparable to no obstacle at all and make them less productive. A man works hard in moderate cold weather to keep himself warm and well-fed but a person in tropics does not have to put too much effort for food and shelter. Similarly, human effectiveness also changes with the changing weather conditions. In summer, a person tends to be less productive and in cold weather, he tries to be industrious.
