## Topic: AI Might Improve the World.

In an era where information flows ceaselessly, where innovation reshapes industries overnight and where the world evolves at a relentless pace, Artificial Intelligence (AI) emerges as the compass that may bring positive changes in different fields and might improve the world.

AI tools help to fight against climate change.

Every one wants a silver bullet to solve climate change; unfortunately there isn't one. But there are too

lots of ways AI can help fight climate change. The

first role AI can play in climate change is distilling raw data into useful information - taking big datasets, which would take too much

time for a human to process, and pulling information out in real time to guide policy or e-sector action. For instance, taking satellite imagery and picking out where deforestation is happening, how biodiversity is changing, and where coastal communities are at risk from flooding. These kinds of tools are already starting to be used by organisations around the world.

In addition, AI is making huge changes in healthcare. There is a rapid transformation in the pharmaceutical industry and university research, where they are shifting to the use of AI to help discover new molecules and new drugs that would have fewer side-effects, and that would help cure diseases that are currently uncureable, including cancer, potentially. Apart from drugs, use of AI in medical reports

and results making is unprecedented. Before it was hard for doctors to diagnose disease but now different advanced machines can do the test efficiently. For example, MRI, CT-scan and different laboratory tests can be done easily to diagnose diseases.

Furthermore, the use of AI in crime and policing has made formidable changes and outcomes. Investigation without modern techniques and tools is difficult or somehow not possible. Police utilizes different techniques to pursue the culprit, such as, autopsy, evidence from crime spot, use of CCTV cameras, and the foremost forensic lab. AI technology can offer valuable tools for analyzing data, identifying patterns and aiding investigations.

Like wise, the use of AI tools can't be ignored. AI tools such as Chatgpt, Bard, Bing, Open AI and many more have made great progress in education sector. The dependency on technology was felt during pandemic when Covid-19 threw a spanner on the life of every individual and it's was hard to take physical classes, technology perform it's due role. That's was the time when online classes emerged. Now, different tools are found productive in education sector.

In conclusion, undoubtedly, AI has made productive changes but the use of AI in different sectors need serious consideration.

It is probably going to take years in order to make AI fully secure and efficient, but it's going to be an amazing revolution.

Write simple sentences to avoid structural mistakes

# Sample body Paragraph.

Topic: How to improve concentration.

Sub heading: Manage your mind.

Topic Sentence: During study, it is imperative to manage your mind in the best possible way.

Explanatory Sentence: The reason is that every student while studying makes mistake and fails to understand something sufficiently. This creates doubts in mind and leads to skipping of topics skill to be used, and so on.
