

First misuse of AI is the creation of deepfakes like spreading fake scandals through social media or creating fake audio and editing photos by using AI technology. These content can be used to deceive, defame or manipulate individuals and events. For example in now a days some people create fake snaps and videos to defame and blackmail other people.

As AI continues to advances. it has brought threat regarding personal data privacy. AI system often rely on vast data to improve its performan. This data can be consist of personal information such as names, addresses, financial information and sensitive information such as medical records and security number. Some people and organizations can hack this data due to weak

Security and by using this information they can cause loss of related person. Some hackers can hack bank account due to weak security and passwords, and cause financial loss of people. AI data could fall into wrong hands either through hacking or other security breaches.

With security issues ~~the~~ AI has another issue that is there is no strict or proper rules and law for using AI technology due to which many people creates fake profiles on social media and deceive innocent people. For example Facebook has 3.03 billion active users but the most profile on facebook are with wrong information. There are no rule for creating profile even a child can also create profile with wrong information. Some people can create multiple

multiple accounts on facebook

So, AI has dramatically improved our world but it has some bad effect such as AI cause unemployment because Robots can work better than human in different sectors. Due to AI there is a significant transformation in bussiness education, markets, health centers and in govt sector. AI work better than human and it has numerous benefits if implented ^{me} day to day in life by making work faster and easier. But it replaced by human and create a major problem that is unemployment.

However with the passage of time AI technology improved but it has a negative side. The most countries do a huge investment on wrong use of AI technology. They wants only advance their

technology which have no beneficial for them and for humanity. Some invest on AI technology to harm their enemy country. They steal their important data for their own benefits.

Intellectual theft is a main issue of AI technology. People creates their designs, logos and artistic creations but some people steal these idea or creates duplicate things that can harm individual and bussiness. There should be a registered trade mark or copy right that no body steal intellectual data.

Education in present day also depend on AI technology. children depend on AI for making assignment instead of using books. Habit of learning books are becoming slow. In the most institution

AI technology are used for learning purpose instead of Teachers.

There are some solutions that may overcome this misuse of Artificial intelligence.

First of all AI machine can do multiple task at same time and performed better than human. AI machine can solve many problems as human do. AI machines can't do any mistake as human do. For example AI can use in health sectors to diagnosed diseases. So AI can help human if it used in positive tasks.

Secondly, There should be take some necessary steps to secure data. It is crucial to keep your device up to date with latest security. Avoid sharing personal information on social

media and make sure to use strong and unique passwords for your accounts. It's a good idea to create privacy settings on your social media accounts and only share information with people you trust.

Thirdly, Arms race should be ban, Nations invest on Arm for power, Some country are worked on AI arms that may be fatal for humanity.

Fourthly, Training and education for AI use are very necessary for its effective and responsible use. Govt should create institute that gives education and gives awareness the positive and beneficial use of AI.

Fifthly, fairness and bias mitigation are important aspects of any system. When

It's essential to regularly evaluate and test the AI systems for potential biases and take corrective measures.

Sixthly, we should promote the positive use of AI technology in various fields, e.g. In healthcare, In transportation, AI can also deal with ~~see~~ customers through chatbots and virtual assistants.
