

Heatwave:-

Every year the people says the same thing, "This summer is very hot." It has been years that people are facing same heat issues, and the pharase does not change. Pakistan geographically located on the equator. Sun rays falls directly on the equator that increase the temperature of the country. It is <sup>just</sup> not about Pakistan, this is about all other Asian countries. Even in Saudi Arabia 13,000 people has died during Hajj. In India they gave the warning and red alert of heatwave. There are so many people who are dying due to heat stroke. There are many who have no homes, they are living and sleeping on the roads. As far as load shedding concern, what about the people who are living on roads. How they are going to survive in this summer. The temperature of the country is very high this year, what <sup>is</sup> <sup>wondered</sup> will happen next year. Government cannot change the location of the country but all other

Consensus is very important <sup>for how</sup> ~~to~~ control  
the ~~increase of~~ heat on this issue  
They have to decide and make rules  
to control the burning of Green house  
gases. ~~can~~

Our Government, all they can do  
to make some rules in the country  
to prevent from dying, like  
timing for employes to work, clean  
water availability in every part  
of the country, and no less load  
shedding. Some of private universities  
and schools are still open in  
the peak of heat, government should  
make rules to close all the school  
and or private sectors in the summer.  
Those schools or universities <sup>can</sup> make  
shift their classes from physical  
to online.
