

Unreasonable Use of Resources and its Repercussions

Author argues about ill implications of illogical use of resources by man and inventions made by him. Discovery of combustion helped him in protecting, warming and preservation of food. Then fire helped him in extraction of metals and generation of power but its later use in explosives wreaked havoc. Moreover, his discoveries in use and control of air are not remarkable as humanity is suffocating because of poisoned air and there is no way out. Although man has excellently used water resources but unable to tackle with excess and scarcity of it. Along with that man is destroying natural habitat of animals by cutting woods for his own sake. Similarly, his excessive cropping and animal grazing is wipe out top fertile layer of soil. Furthermore, he is producing for humanity but later on rot it by hoarding because he is unable to distribute it in handsome amount. He has invented machine but now worried about job replacement. Hence, unreasonable use of resources which became cause of his own destruction depicts that man is not wise in using them for his own benefits.
