

Chip - Taiwan

Planet earth became a global village with the advancement of technology. Internet being the whole village and smartphones and laptops being houses in these villages. All smartphones, laptops, modern vehicles, all kinds of computer system all around have a chip inside them. A chip made of silicon, a semi-conductor. Billions of transistors are installed in one tiny chip which allows the user to command their device and get the desired results.

More than 60% of these semi-conductors are produced in Taiwan, and around 90% advanced ~~are~~ ~~produced~~ ~~in~~ ones are produced. TSMC is the

largest semi-conductor manufacturing company. "Taiwan semi-conductor manufacturing company" Unveiled the art of fabrication of chips and bring day to day innovations in its production. With the yield of TSMC producing it has become the hub of modern technology and a threat to some countries.

The country on spotlight in this regard is the United States. It fears that the access of China to these Taiwanese chips will cost America. China will use these for production of modern warfare arms, hence its fear pushes it to ask Taiwan to not send the chips to China, but the CEO of TSMC thinks otherwise. He thinks that what America is contemplating is a complex process which China won't be able to do on its own.
