

(CSS-2018) "Human Activity in Different Seasons"

Climate has different effects on humans. The cold climate demands more energy from humans by acting as an obstacle. When there are a lot of obstacles then human energies are numbed. But complete absence of obstacles leaves no reason for strenuous work. So, it is the moderate cold climate that acts as a reason to work hard.

The humans search for food, build houses and make thick clothes. On contrary, in the hot season calls for little ~~strenuous~~ work from humans.

There is less need of clothes and fire. And life can be sustained with less food. Therefore, we can say that we take our lives easy in hot ~~weather~~ or moderate season and difficult in cold or ~~weather~~ season.
