

Environmental Pollution

Environment is the basic unit for the existence of all living and non-living things. Despite being imperative, it is facing significant challenges in the face of environmental pollution, which includes water pollution, air pollution, soil pollution, and noise pollution. Due to socio-economic activities of humans, the issue got more adverse. The activities include burning of fossil fuels, deforestation and urbanization, and smoke released from outdated vehicles. Moreover, radioactive elements released by nuclear experiments into the air, water and land cause the problem. Consequently, cardiovascular diseases, diarrhea, breathing issues and other

diseases spread. Global warming and climate change are also products of such activities. Furthermore, psychological problems increase due to noise pollution. Lavish lifestyle of the people urge them to use private vehicle that results into increased traffic, causing air pollution. However, taking timely actions would prove to be a ray of hope in dealing with the menace. Use of public transport and electric vehicles would not only reduce environmental pollution but also promotes good health. In addition, spreading awareness about severity of the issue and afforestation could mitigate the issue. To sum up, environmental
