Topic: "Artificial Intelligence: The Death of Creativity"

Outline:

1) Introduction

Thesis Statement:

The onset of artificial intelligence has led to the death of human creativity. It is evident in various forms across various sectors. However, certain steps have the potential to combat the challenge of the death of creativity by artificial intelligence.

2) Why death of creativity has occurred due to artificial intelligence

2a) Lack of political will to control artificial intelligence

2b) Shortcomings of modern education system in giving creative education

2c) Lack of a global body to contain artificial intelligence.

3) How there is death of Creativity due to artificial intelligence

3a) Overreliance of students on AI tools
(ChatGPT phenomenon for trivial matters).

3b) Dependence of teachers and professors on AI for preparation

[Classroom planning, lesson plan, etc.]

- 3c) Fading creativity of writers due to dependence on artificial intelligence
[The Atlantic Report]
- 3d) Doctors in healthcare depending upon artificial intelligence for trivial concerns
[Koko App. in United Kingdom]
- 3e) Film industries depending heavily on artificial intelligence and threat to human creativity
[145 days protest by the Hollywood actors]
- 3f) Workforce relying heavily on AI for CVs, Reports, etc
- 3g) Artificial Intelligence further pushing against the wall the creativity in the already dismal education system
- 4) Case of Pakistan and the death of creativity by artificial intelligence
[education system prone to artificial intelligence; national AI policy]

(3)

5) How the menace of the death of creativity by artificial intelligence be tackled

5a) Creating political will to restrain the artificial intelligence

[Book "The Tech That Comes Next" by Afua Brue]

5b) Making education system creative

[Noam Chomsky, Einstein about the real purpose of education]

5c) Formulating a global body to control artificial intelligence

[Like the International Atomic Energy Agency and IMF, suggested by Elon Musk, etc]

6) Conclusion

↓ Concluded the essay with the following note:
"If handled properly, artificial intelligence can benefit humans by improving their creativity".

According to the famous writer Noam Chomsky, human is much more intelligence than any artificial system. But, in today's world, the human creativity has been challenged by the emergence of artificial intelligence. There are various reasons as to why the artificial intelligence has resulted in the death of creativity in humans. First and foremost is the lack of political will to control it. Second is the inability of the modern education system to produce creative people. Last but not the least, lack of a global body to contain AI is also leading to the death of creativity. That artificial intelligence is leading to the death of creativity is evident in a number of factors. The factor of most concern is the overreliance of student on AI tools for all kinds of tasks to be done by their own creativity. Similarly, the teachers and professors are also depending heavily on artificial intelligence for their lecture preparation. In the same vein, the creativity of writers is fading owing to their reliance on artificial intelligence. Also, the doctors in the health care have started using artificial intelligence for trivial concerns. In the film industries, human creativity is being ignored after the emergence of artificial

(5)

intelligence. Likewise, workforce is also relying on AI tools for generating CVs, reports, etc. Last but not the least, artificial intelligence is further pushing against the wall the creativity in the already dismal education system in many countries of the world. However, certain steps have the potential to mitigate the challenge. First is the step towards political will to restrict the technology. Second is the standardization of modern education system so that people do not rely on artificial intelligence. Last but not the least, the creation of a global body will come in hand in controlling artificial intelligence. The discussion goes on, and the onset of artificial intelligence has led to the death of human creativity. It is evident in various forms across various sectors. However, certain steps have the potential to combat the challenge of the death of human creativity by artificial intelligence.
