

Medicine in excess is poison

Medicine is to cure and has never been a poison, except when used beyond limits. Some drugs, for instance, are ^{addictive} ~~additive~~ but doctors prescribe ~~them~~, ^{these} because of its fascinating efficacy in a particular disease. ^{The effect is the same as produced by} These drugs have sedatives which keep the brain calm and free that ~~is an effect just produced by~~ a cigarette or any other intoxicant. So patients, if not properly supervised, start using it more and more to suffice their needs, but in reality the drug is ^{Captivates} ~~captivating~~ the brain and ultimately the dose gets higher. And patients fall victims to its beguiling effects unwantedly and unconsciously, because it keeps them gay and above all in fantasies. ^{so} Instead of getting cured, patients are dispossessed of their freedom and held prisoners of their brain and drug. It is evident in a movie based on true story "The Pain Hustlers" that how an opioid product Lonafen wreak havoc on people and cancer patients by its enchanting effects to ~~cure the pain~~ and of curing and dampening the pain of cancer patients and general public. People easily got addicted ~~to Lonafen~~ which affected their ~~whole~~ life. So, it signifies that if a medicine is used excessively, it will always result in ~~a catastrophe~~. ^{Result into}
