

Global boiling

On July 2023, Secretary General Guterres introduced the term "Global warming" to describe the escalating impact of climate change, indicating the planet is transitioning from global warming to a more extreme and perilous state.

For instance this year, Haj turned tragic, 13,000 pilgrims succumbed to soaring temperature Saudi Arabia faced extreme hot weather condition. Earlier in this month Pakistan and India has faced the same condition. In Sindh the temperature was 52.1°C and Mohenjindero has experienced 52.2°C temperature.

The Indian meteorologist department has issued red alert for the country's longest ever heat wave. Over 100 deaths and 1000 heatstroke cases have been reported. The temperature of Delhi has reached 42°C that affects the quality of life and ecosystem.

In UAE, Dubai has experienced

flood due to heavy rainfall. The flood wreaked havoc, resulting in death in UAE and Oman. Dubai experienced record-breaking rainfall, heaviest in over 75 years. ^{over} 1000 of flights were cancelled, due to extreme bad condition of weather.

Such rainfalls have led to flooding and fatalities in Pakistan and Afghanistan. Several deaths have been reported due to heavy rainfall.

These extreme weather events becoming more frequent, disturbing and affecting human health and ecosystem. The weather is so unpredictable. These heat waves melting glaciers that cause flood, thawing of permafrost releases green house gas methane, exacerbating global warming.

There is ^{urgent} need of quick actions to mitigate the escalating climate change conditions. Climate change does not ^{only} effect variety of life but also has impact on country's economics.
