3.6 Future Threats

4. Conclusion

Essay

A long time ago, a severe disease spread over in Athens. This disease had blown out the lives of thousands of people. The people went to the priest and asked him what to do, but he was unable to get the answer. At that time, a smart doctor

named Hippocrates figured out the treatment of that disease. He showed that educated experts can make a big difference in people's lives. The value of these experts cannot be denied as it is crucial for every nation's development. Unfortunately, in Pakistan, there is a brain drain of highly skilled and educated individuals from the previous few years. Experts like teachers, doctors, engineers and even businessmen are moving at large scale to other developed countries. This is happening because of their own country's fewer resources and opportunities. They see a ray of hope to have a better life and a better future in developed countries. Brain drain is like eradicating optimistic hopes and creativity from the country. It has multiple causes that drastically impact national growth and the new generation's trust in its state.
