Title: Sustainable Development: Co-existence of Urban and Natural Life.

In the urban concrete spaces, an effort to build green areas not only provides a recreational space but also a sanctuary for wildlife. Despite providing aesthetic beauty, they help in the development of better social relations by giving a space for arranging sports, cultural and artistic events. Along with this, urban green spaces have limitless benefits in mitigating psychological and physical health issues by reducing climate change. So, for the sustainable development of cities the joint venture between urbanization and green spaces serve the purpose of healthy survival.
