education equally protect
~~the rights of all citizens~~
- i) Education dwindles poverty
rate
- j) Economic prosperity hinges
upon the level of education
~~a nation offers to its~~
citizens

make short and self-explanatory
phrases

3, Conclusion

"Education is a matter
of life and death for
Pakistan. The world is pro-
gressing so rapidly that
without requisite advanced
education, we lag behind
others and may be wiped
out altogether" (MA Jinnah)
This saying by the founder
of Pakistan, Muhammad

Ali Jinnah, clearly highlights the importance of education in relation to the success and prosperity of a nation. At the same time, this quotation subtly captures the rapid advancement of the world and how education is the perfect measure of the soul of a nation.

such lengthy sentences does not convey any ideas

The reason for this is that the level of education a state provides to its citizens plays a crucial role in their development and their ability to engage, think, reason, and differentiate the truth from falsehood. This then, ensures that a nation is not only free from extremism, crime, and other social evils, but also is

a driver of innovation,
democracy, and equality.

To start with, countries that do not focus on education have high levels of extremism. The reason for this is that without education, individuals are unable to think clearly and logically, which then facilitates the creation of a hostile environment. The perfect example of this is Afghanistan whereby intolerance has reached heights such that women in the name of religion are barred from pursuing higher education and people lack freedom of speech. At the same time, Afghanistan has become the perfect breeding ground for outlawed out-

Fits, such as the Tehreek-i-Taliban Pakistan and Islamic State Khorasan Province. ~~Simply put,~~ the quality of education a nation offers to its citizens indicates the level of peace, stability, and tolerance in that country.

Other than extremism, countries with uneducated citizens are likely to have high crime rates. ~~Given that without education~~ individuals fail to develop the skills required to prosper in life, many individuals, ~~with little to no understanding of the consequences of their actions,~~ resort to crimes to make a living. In Pakistan, for example, mushrooming

Crime rates have been witnessed due to the economic as well educational crisis that the nation is currently mired in. This makes it plain that education and crime are interlinked, and the level of education of citizens can be used to measure and predict crime rates.

Another factor which further strengthens the argument that education measures the soul of a nation is that democracy cannot effectively function in a state with uneducated citizens. Participation in a democratic system primarily rests on the ability of an individual to identify and address complex problems, which can only be developed

if the state offers quality education to its citizens. This is evident from the fact that Norway, a country with the fourth best rated education in the globe (Data Pandas, 2022) was ranked first in the Democracy Index (Economist Intelligence Unit, Democracy Index, 2023). This, therefore, means that education is a necessary prerequisite to participate in the democratic process.

Moreover, education has an intertwined relationship with public health. Due to their knowledge and awareness, educated individuals are more likely to have to follow healthy

eating patterns as compared to their uneducated counterparts. Empirical evidence reveals that educated citizens are not only less likely to be obese and smokers, but are also face a lower risk of developing mental health illnesses due to their financial stability (Raghupathi, The Influence of Education on Health: An Empirical Assessment of OECD Countries for the Period 1995-2015, 2020). In this way, then, education plays a pivotal role in furthering public health interests.

Apart from promoting healthy eating, education also works to equip individuals with the ability to operate digital technology.

gies safely and appropriately. This is not only crucial to for minimising cyber bullying, misinformation, etc, but more importantly ^{also} plays a key role during times of emergency. Ukrainians, for instance, are connected with their government amidst the war with Russia via the Diia app, always ^{keeping} ~~remain~~ ~~ing~~ informed about emergencies and how to escape them. Simply put, by equipping citizens with the required skills to prosper in the contemporary age, quality education works to promote safer and smarter use of digital technologies.

~~In addition to this,~~

~~education creates a skilled workforce~~ ^{IF} ~~this improves the efficiency of workers in that they are~~ able to operate complex technologies and machines, which boost economic growth. This is evident from the case of China, the second largest recipient of foreign direct investment due to its massive pool of skilled workers (The State Council of the People's Republic of China, 2022). In this fashion, education empowers the workforce and fosters economic growth.

~~Another factor which reinforces the point that~~ education is measures the soul of a nation is that education aids in-

dividuals in innovating and creating new technologies. This is because, ~~educated individuals~~, with ~~they have~~ their extensive knowledge and high levels of creativity, which enables them to research and innovate.

it does not convey any sense

~~This can be evidenced from the cases of China, America, and Great Britain, all of whom have played a pivotal role in developing new technologies, such as social media, artificial intelligence, and the internet. In this way, education aids individuals in innovating new technologies.~~

Apart from fostering innovations, education also works to bridge the unjust gap between men and

women. By instilling in individuals the knowledge and skills required to understand the dynamics of unequal power relationships, education has helped reduce gender discrimination. Countries with educated individuals such as the United Kingdom afford more rights to women as compared to countries with illiterate masses such as Afghanistan whereby women lack the basic right to freedom. In the UK, women are given the opportunity and the environment to realise their true potential and contribute to bring in real change in the nation. This again highlights the importance of education, which not only promotes

gender equality, but also helps assess the level of tolerance and inclusivity in a country.

write short sentences plx

Furthermore, education also has an impact over poverty rates. This is because, education unlocks a range of opportunities for individuals, which makes them financially stable. Pakistan, for example, has the second highest number of out of school ^{children} (22.8 million) worldwide (Unicef, 2024) and has a poverty rate of nearly 40 percent, according to the World Bank. Comparatively, Japan, which places great emphasis over education, merely

has a poverty rate of 15 percent (Statista, 2021). Therefore, poverty is directly linked with the quality of education a nation provides to its citizens.

Lastly, education is the main determinant of the economic prosperity of a nation. Countries that attach great significance to education ensure that their citizens can not only operate and create new technologies, but are also able to critically plan for the future. Singapore, a country with a gross domestic product (GDP) per capita of over USD 82,000 allocated more than 13 percent of its GDP to education, with a special focus on

Science and technology. In a similar vein, Switzerland which exhibits the second highest mean years of schooling in the globe has a GDP per capita of USD 93,525. In contrast, Africa with the lowest mean years of education, has a GDP per capita of merely USD 1,637 (Blain, The Most and the Least Educated Nations and Their Impact on Prosperity, 2024). This, thus, suggests that education is the perfect measure of the economic condition of a nation.

work on transi

To sum up, it has been established that education is the perfect indicator of the soul of

a country. ~~Not only~~ are ~~countries~~ with ~~uneducated~~ citizens & economically ~~weak~~, but are also promoting terrorism and extremism. On the other hand, educated citizens are the drivers of social, political, and economic success. This is succinctly captured by the Global Partnership for Education which asserts that "Education is a powerful agent of change, and improves health and livelihoods, contributes to social stability and drives long-term economic growth." In light of this, it is thus, expected that nations will attach more significance to education, especially Pakistan, to fulfil the dream of Quaid.
