

# Topic: Human Health is a Silent victim of Global warming

## Outline

### 1. Introduction

Global warming is continuously affecting human health. It is increasing due to emissions of GHGs, deforestation and transportation. It is impacting human health by increasing infectious and respiratory diseases. Thus, there is need to adopt such measures that mitigate global warming's impacts on human health.

### 2. How human health and global warming is interlinked?

### 3. Factors which contribute to increase in global warming and make human health its silent victim

3(a). Emission of greenhouse gases leads to promote global warming

3(b). Increase in global warming due to combustion of fossil fuels in transportation mediums

3(c). Release of hazardous gases in industrial processes is contributing

in global warming

3d). Deforestation is causing accumulation of  $\text{CO}_2$  in atmosphere

3e). Release of methane in agriculture livestock

3f). Improper wastage management system leads to the release of methane which contributes in global warming

#### 4. Impacts of global warming on human health

4(a). Increase in infectious diseases

4(b). Global warming is causing respiratory diseases

4(c). Rising malnutrition due to insecurity of food supply

4(d). Heatwaves are causing increase in mortality rate

4(e) major injuries by high intensity of floods

5. How impacts of global warming on human health can mitigate?

- 5(a). Reduction in greenhouse gases by using renewable resources
- 5(b). Restoration of forests
- 5(c). Shift from conventional transportation mediums to electronic means
- 5(d). Established international agreements to reduce/decrease global warming
- 5(e) Adoption of environment friendly chemical in industrial process.

## 6. Conclusion
