

Areej Farooq: Batch 53

Precis : 2018

Precis Title:

- Effects of Climate on Human Behaviour. **OR**
"Climate and Human Behavior: Comparing Hot and Cold Climate."

Precis:

The good ^{effects of cold} temperate [←] are more noticeable in Northern Europe. Cold Climate gives more energy to overcome the obstacles it presents. When we encounter any obstacle that seems difficult we feel despair on the other hand it gives motivation and strength to overcome but when we have obstacle than we can't use our energy. As extreme cold ^{climate} makes people sluggish, very hot weather doesn't inspire much activity, moderate cold seems to energize people. In moderately cold weather people face tough challenges but they don't feel like they cannot overcome them like they have to build home and cut trees to fuel their fires to keep themselves warm. Life is different in Tropic areas near the Equator they do not need such things. They can spend whole day laying under the tree without any health risk. People earn their living through very small amount of energy. We might notice similar contrast between people's behavior during different climate. When it is hot people feel more relaxed and lazy but in cold weather they feel more motivated and active both mentally and physically.
