

Topic:

Human Health is a Silent Victim of Global Warming

Outline :-

1. Introduction

Global warming is a creeping cause of degrading human health consequences of which can be dire and call for timely preventive measures if *Homo sapiens* is to further as a successful species.

a. Correlation of worsening human health and rising global warming

3. Planetary warming is deteriorating human health indicators as both primary and secondary repercussions of surging temperatures

A. Vector-borne tropical diseases spreading beyond tropics

B. Global food insecurity fanning flames of malnourishment and higher mortality rates

C. Melting glaciers: a can of worms unleashing hitherto dormant pathogens

D. Flash floods and dirty ponds of stagnant water breeding cholera epidemics

E. Wildfires incidents sending plumes of hazardous gases and particulate matter into air causing pulmonary complications

F. Deaths in heat strokes during extreme temperatures in summertime

4. Preventive measures to rein in disastrous impacts of global warming on human health:

- A. Aggressive apprestation to make for improved air quality index
- B. Naturally vented, passive infrastructure for air conditioning
- C. Structural interventions for handling extreme weather patterns: dams, levees and embankments
- D. Investment in research and development for vaccines
- E. Availability of public reverse osmosis filtration plants.
- F. Climate justice for poorer and disproportionately affected global hotspots

5. Conclusion
