

Cold Climate: Stimulator of Human Energies

Cold climate stimulates human energies. When facing an insurmountable obstacle or no obstacle at all, human energies are not exerted. Similarly, an extreme cold climate dims human energy while a hot climate provides little motivation to exercise it. It is only in a moderately cold climate that human energies are most activated. This is because one's struggles are challenging but not hopeless. To sustain such climate, one has to struggle hard to get a strong shelter, thick clothes, fire and nourishing food. In contrast, a person living in tropics has little need of all this. Hence, similar to

Same differences are found everywhere else as seasons change. People tend to make little use of their energy during hot weather while rigorous use of it during winter season.
