

Topic: Climate Change: Causes and Consequences

Outline:

1. Introduction:

Thesis Statement: Climate change is caused by both natural and human activities. It has severe consequences on environment as well as human health. However, there are some specific strategies that help to mitigate the risks of climate change.

2. The causes and consequences of climate change.

3. Causes of climate change:

a. Natural methane source contributes to climate change.

b. Volcanic eruptions impact climate patterns

c. Fossil fuel combustion derives climate change.

d. Agricultural practices exacerbate climate change

e. Deforestation worsens the climate change.

f. Rapid industrialization contributes to climate change.

g. Climate change is caused by transport sector.

4. Consequences of climate change.

a. Raising environmental temperature is the result of climate change.

b. Changes in precipitation patterns and melting glaciers cause water scarcity.

c. Extreme weather events exacerbate food insecurity globally.

d. Displaced populations living in temporary shelters are particularly vulnerable to disease outbreaks.

e. Destruction of agricultural areas due to flooding and storms hinders economic growth.

f. Ocean acidification due to climate change harm marine life and ecosystem.

5. Strategies to ~~mitigate~~ mitigate the risks of climate change.

a. Raising awareness about the impacts of climate change.

b. Transition to renewable sources of energy.

c. Secure adequate finance through COP summits to support the implementation of national climate plan.

d. Sustainable land use is crucial for reducing climate change.

6. Conclusion.
