

Climate Change: Causes and Consequences

1-1-20

1 Introduction.

2 Causes of climate change.

a Concentration of carbon dioxide, methane, nitrogen oxide and sulphur oxide -

b Excessive use of insecticide lubricants and Fertilizers -

c Nuclear Radiation -

d Deforestation -

e Burning of fossil fuels -

f) Chloroflouro carbon and depletion of ozone layer.

g) Explosion of Population -

3 Consequences of climate change

a Rising of hot temperature

b More severe storms

c Increasing drought

d Rising of warm ocean

e Loss of species -

f) No Decline Agriculture product

g) More health risk -

4 Measurements to encounter it.

a Use of ~~renewable~~ renewable energy.

b Energy conservation

c Forest planting.

5 Conclusion -

_ _ _ Et

“The world must come together to confront climate change. There is little scientific dispute that if we do nothing, we will face more drought, famine and mass displacement that will fuel more conflict for decades.”

-Barack Obama- climate change refers to long term shift in temperature and weather pattern such shifts can be nature due to change the suns activities or large. Human activities, such as burning fossil fuel and destroying rainforests have an increasing influence on the climate and earth's temperature. There is multiple causes which effects on climate change. Concentration of carbon dioxide methane, nitrogen oxide and sulphur oxide. as well as ~~Excess~~ excessive use of insecticide lubricants, fertilizers, nuclear radiation and deforestation. Explosion of Population Burning of fossil fuels, depletion of ozone layer and chlorofluro carbon are the main causes of climate change. However, consequences of climate change

_ _ _ 35

change occur simultaneously, ~~the~~ hotter temperature more severe storms, increase drought - rising of warm ocean is the result of climate change.

Decline agricultural products, loss of species and more health risks are consequences of climate change.

In other words, huge causes as deforestation, nuclear radiations, burning of fossil fuel and explosion of population brings a lot of consequences in climate change.
