Species struggling for the survival.

"Plastic will be the main ingredient of all our generations" Anthony T. Hinkle.
To live on earth smoothly/peacefully is a ~~right~~ natural right of each creature that exists on it. Unfortunately, trillion of species are at risk in oceans, owing to the a billion of plastic ^{waste} that is produced and throwned by land resome globally. Moreover, due to plastic waste over 1 million seabirds and 1 lac mammals die each year, this depicts that how ^{much} gravely they are being affected by human induced actions. Furthermore, plastic pollution donot only disturb sea life but also it can pose a serious threat to the eco-system which may results into cyclones, floods and many more disasters. It has been projected that by 2050 there could be more plastic than fish in the oceans by weight. However, plastic being ^{non-}degradable in its composition may take thousands of year to decompose. As a result nations which are serious for the marine life and for their survival need to add more percent into global plastic recycle which is approximately 9% only, for the survival and prosperity ~~of~~ of our future on this planet.
