

# Climate Change: Causes and Consequences

1.1.20

## 1 Introduction.

## 2 Causes of climate change.

a Concentration of carbon dioxide, methane, nitrogen oxide, and sulphur oxide.

b Excessive use of insecticide, lubricants and Fertilizers.

c Nuclear Radiation.

d Deforestation.

e Burning of fossil fuels.

f) Chloroflouro carbon and depletion of ozone layer.

g) Explosion of Population.

## 3 Consequences of Climate change

a Rising of global temperature

Rising temperature

b More severe storms.

c Increasing drought

d Rising of warm ocean

e Loss of species.

f) No Decline Agriculture product

g) More health risks.

## 4) Measurements to encounter it.

a Use of ~~renewable~~ renewable energy.

b Energy conservation

c Forest planting.

## 5) Conclusion.

Together

"The world must come ~~together~~ to confront climate change. There is ~~little~~ ~~dispute~~ that if we do nothing, we will face more drought, famine and mass displacement that will fuel more ~~conflict~~ for decades."

There is a little

-Barack Obama- climate change refers to long term shift in temperature and weather pattern. ~~Such shifts can be nature~~ ~~due to change in sun's activities or large~~ ~~Human activities, such as burning fossil~~ ~~fuel and destroying rainforests have~~ ~~an increasing influence on the climate~~ ~~and earth's temperature.~~ ~~There are~~ ~~multiple causes~~ which effects on climate change.

Can be nature induced

Concentration of carbon dioxide, methane, nitrogen oxide and sulphur oxide. as well as ~~Excess~~ excessive use of insecticide, lubricants, fertilizers, nuclear radiation and deforestation. Explosion of population, burning of fossil fuels, depletion of ozone layer and chlorofluro carbon are the main causes of climate change. However, consequences of climate change

There are multiple causes

Command over basic language is fine

\_ \_ \_ 35

change occur simultaneously, ~~the hotter~~  
temperature, more severe storms, generate  
drought - rising of warm oceans  
the result of climate change.

Decline agricultural products, loss of  
species and more health risks  
are consequences of climate change.

~~In other words~~ - huge causes as deforestation  
nuclear radiations burning of fossil fuel  
and explosion of population brings a lot  
of consequences in climate change.

Basic language is  
fine
