Essay

There are always advantages and disadvantages ~~to~~ of technological advancements. When machine automation came during the industrial revolution, people started fearing the loss of jobs to machine automation. However, it created more jobs for people rather than replacing them. Nowadays, there is a new debate about the emerging Artificial Intelligence technology: is it a reformer or a tyrant. As a reformer, it is revolutionizing agriculture to boost yields and reduce food insecurity. It is bringing precision to military operations to minimize casualties. AI systems can predict climate disasters. AI-powered educational tools are accessible globally to learn from quality resources. It is supporting doctors and predicting health risks. AI innovations are creating jobs across multiple sectors. Contrary, it threatens freedom of expression and its over-reliance could reduce human creativity, innovation, and skill set. Furthermore, the deepfake technology is being used for political outcomes. It is exacerbating environmental

issues and AI automation could lead to unemployment for semi-skilled and unskilled workers. In addition, these systems could perpetuate biases based on data they are trained on. However, balance between AI advancements and societal values, human touch for indistinguishable scenarios, and regulatory frameworks to eradicate its misuse could reduce its disadvantages. Moreover, Artificial Intelligence is a double-edged sword, it has the potential to be both a reformer and a tyrant. There is a need of well-derived strategy to balance its dual role.
