

The third is increasing of solid waste in urban cities. Nearly 60% of Pakistan population living in urban cities and it's gradually increasing. The government have no proper system to deal with solid waste. It cause methane gas which includes in atmosphere to rise its temperature and effects the ozone layer (O_3). Usually, people fire the wastage in cities which become the cause of carbon mono xide (CO), carbon monoxide (CO_2) which have the biggest ^{cause} in climate change. According to IPCC, 44 ppm of carbon dioxide level reached and it is alarming situation for the world. Similarly, the solid waste contribute the gases to atmosphere, It become the cause of rising temperature and harm for biodiversity. So, ultimately it caused the climate change in Pakistan.

Date

Pakistan is one of the leading countries who developed its own weapons which includes ballistic missiles, tactical missiles, tanks, and nuclear bombs etc. After development it has been tested by the army. After conducting the test, it becomes the source of harmful gases which ^{not only} caused the area harmful but also pollute the atmosphere. It releases CO_2 , CO , Sulphur dioxide, nitric oxides which is harmful for trees which eventually protects us from floods and droughts. It is a study of France university that only 23 nuclear bombs are needed to destroy the whole world. So, with increasing the development and testing mass of weapon destruction it rise the temperature globally and Pakistan is paying more than its contribution in the shape of flash flood, and cloud burst. In the end, weapons becomes a major issue in ^{the} changing climate.

The fifth reason is Pakistan have weak policy on carbon emission which gives an unprecedented permission to emit gases beyond the specific level. According to the UN Pakistan is 5th major country in world and in Asia is 1 to face more floods, droughts, and famine in its country due to climate change.

The released gases by industries mostly in Faisalabad ^{not} only polluted water in nearby areas but also

cause temperature to rise. It is causing glaciers to melt and eventually in Pakistan now it is more common flash floods and cloud bursts. It plays an important role in climate change by weak climate policy.
