Deforestation has contributed to increasing Earth's atmospheric temperature. It refers to the cutting down of trees on a large scale. Plants absorb sunlight at maximum level for photosynthesis, plants help to regulate the Earth's atmospheric temperature by absorbing sunlight. On the contrary, if there is no more plants then the sunlight directly hit on the surface of earth that contributes to increase the Earth's atmospheric temperature. By Global Forest Watch "Pakistan lost 481 ha natural forest which produce 68.9kt CO₂ less sequestration of carbon and less absorption of sunlight". In short deforestation has major contribution to increase the atmospheric temperature of Earth.
