

climate changes : Causes & Consequences

Outline

1- Introduction

1.1 - Hook

1.2 - Background

1.3 - Thesis Statement: The Earth is experiencing a fever, with rising temperatures and increasingly erratic weather patterns. There are many Reasons for climate change. Some of the reasons are deforestations, green house effect, glaciers melting, rise of sea level, less rain. There are also outcome for climate change which are hot temperature, ocean acidification, impacts on ecosystem and human life.

2- climate changes Causes

2.1- deforestations

a) CO_2 releases

b) loss of Carbon sinks

2.2 - green house effect

a) human activities eg. Burning fossil fuel for energy -

b) Industry

2.3 - glaciers melting

a) flooding

b) water scarcity

2.4 - rise of sea level

2.5 - less rain

a) drought condition -

b) extreme weather.

3 - Consequences of climate change -

3.1 - hot temperature

a) heat waves

b) Infrastructure damage

c) food insecurity

d) health issues

3.2 - Ocean acidification

3.3 - Impacts on ecosystem and on human life

a) habitat losses

b) displacing human life

c) health risk of biodiversity -
